

1. (5 pts) The following transition table has S the start state and B the final states. Compute the input transition function in tabular form.

Draw the corresponding equivalent NFA with no λ transitions.

	a	b	λ
S	\emptyset	\emptyset	$\{B\}$
B	$\{E, F\}$	$\{B\}$	$\{F\}$
E	$\{F\}$	$\{E\}$	\emptyset
F	$\{G\}$	$\{F\}$	\emptyset
G	$\{B\}$	$\{G\}$	\emptyset

	$\lambda()$
S	$\{B, F\}$
B	$\{B, F\}$
E	$\{E\}$
F	$\{F\}$
G	$\{G\}$

	a	b
S	$\{E, F\}$	$\{B, F\}$
B	$\{E, F\}$	$\{B, F\}$
E	$\{F\}$	$\{E\}$
F	$\{G\}$	$\{F\}$
G	$\{B, F\}$	$\{G\}$

	a	b
S, B, F	$\{E, F, G\}$	$\{B, F\}$
B, F	$\{E, F, G\}$	$\{B, F\}$
E, F, G	$\{B, F, G\}$	$\{E, F, G\}$
B, F, G	$\{B, E, F, G\}$	$\{B, E, F, G\}$
B, E, F, G	$\{B, E, F, G\}$	$\{B, E, F, G\}$

tabular

2. (5 pts) For your converted machine above, draw an equivalent DFA. You do not need to draw the state \emptyset .

The converted DFA could have as many as $2^5 = 32$ states. Only 5 are needed.

$$L(M) = \{w \in \{a, b\}^* \mid n_a(w) \neq 1\}$$

does the same job.
